The first volume of my 2009 blog book, “An epsilon of room“, has now been published by the AMS, as part of the Graduate Studies in Mathematics series. (So I finally have a book whose cover is at least partially in yellow, which for some reason seems to be the traditional colour for mathematics texts.) This volume contains the material from my 245B and 245C classes, and can thus be viewed as a second text in graduate real analysis. (I plan to have one volume of the 2010 blog book to be devoted to the material for the 245A class I just taught, and would thus serve as a first text in graduate real analysis to complement this volume.)

The second volume, which covers a wide range of other topics, should also be published in the near future.

What about an DVD with recorded lectures?

Quora · 3 January 2011

Do you know anyone who has created a book from a blog?...

Terence Tao has one of the best mathematical blogs on the Internet and has been publishing it in book form for a few years now. The blog has included full lecture notes for several graduate courses, which are now available in book form. See, for exampl…
