It's been a while since I've added to my career advice and writing pages on this blog, but I recently took the time to write up another such page on a topic I had not previously covered, entitled "Write in your own voice". The main point here is that while every piece of mathematical research inevitably builds upon the previous literature, one should not mimic the style and text of that literature slavishly, but instead develop one's own individual style, while also updating and adapting the results and insights of previous authors.

Hi Terry,
Well, I can not agree this more.
I also wish authors to write their work ‘in situ’. Anyway, the history is unique. I believe that looking things in an abstract way is harmful, especially abstracting without pointing out the origin.
Here is a polt in my mind.
The other day, one got an idea independently under certain situation and worked it out. There are two cases, among other things: 1) later, he found that someone else had published the ‘same’ work. So, he normally attempted to abandon (i.e. do not publish) his work. 2) later, he found that no one had published the same work; but, when he published it, he found that when other ones tried to understand his work with their own knowledge, his work was apt to be distorted more or less, say relating his work to the existing ones, and getting his work ‘derived’ from the existing ones, although it was not the case for him, and atributed the contribution to authors other than him. I call this ‘reverse plagiarism’ or ‘backward plagiarism’. I believe that it is a common experience for many authors.
So, if the authors are allowed to write their work ‘in situ’, such ‘reverse plagiarism’ may be avoided.

Those who write in polished and understated British style English, a style no one owns, will tend to sound alike, but vast and obvious differences in substance will remain. Moreover, people can tell the difference between Elvis and an Elvis impersonator. So don’t worry.

Kareem Carr · 23 April 2010

This is somewhat tangential but falls under the general category of individual style in mathematical writing:
