Mathematical research and the internet

Terence Tao · 27 August 2009

https://terrytao.wordpress.com/2009/08/27/mathematical-research-and-the-internet/

tao2typ · converted to Typst 2026-10-14 (UTC)

I'll be in Australia for the next month or so, giving my share of the Clay-Mahler lectures at various institutions in the country. My first lecture is next Monday at Melbourne University, entitled "Mathematical research and the internet". This public lecture discusses how various internet technologies (such as blogging) are beginning to transform the way mathematicians do research.

In the spirit of that article, I have decided to upload an advance copy of the talk here, and would welcome any comments or feedback (I still have a little bit of time to revise the article). [NB: the PDF file is about 5MB in size; the original Powerpoint presentation was 10MB!]

[*Update*, August 31: the talk has been updated in view of feedback from this blog and elsewhere. For comparison, the older version of the talk can be found here.]

[*Update*, Sep 4: Video of the talk and other information is available here.]

Comments (31)

Gary Ruben · 27 August 2009

I'm looking forward to your talk next week in Melbourne. This might be of relevance and interest: . If they can do this, hopefully the next obvious step for these guys would be to get Sage working within Google wave.

Gary Ruben · 28 August 2009

Looks like the link was removed from my post. Second attempt
http://www.nabble.com/scipy-in-google-wave-(screenshot-attached)-td24884567.html
If this fails, Googling "scipy in google wave" will bring up a Nabble archive of a recent post showing a scipy session running inside Google Wave. My point was that, if they can do this, getting Sage going should be a doddle.

Anonymous · 27 August 2009

Interesting presentation. I wish I could hear you present it.

I was looking at the graph at page 45. It seems odd that 100% of the world population own an airplane, while only 75% own a car and only 95% own a telephone. Just my 2 cents.

Terence Tao · 28 August 2009

Hmm, that is strange. The graph is based on a graph of Nicholas Felton, available for instance at

but the latter doesn't mention airplanes at all. (I was actually looking for the latter, but found the former instead, and didn't look too carefully to check the difference.) I think I will switch to the latter graph in the presentation.

 **uwestroinski** · 27 August 2009

Very interesting talk. Just two observations:

1) Your remark on mathematics in Wikipedia is cryptic. Intentionally?

2) When I read the title I expected at least a small remark on the relation of printed media and the internet. What happens to the old technologies? Do journals have the same fate as the typewriter?

>  **Terence Tao** · 28 August 2009
>
> 1) I wasn't being cryptic. One of wikipedia's great strengths is its ability to constantly improve its pages over time, which is one reason why I tend to have a preference to link to their pages, all other things being equal. On the other hand, specialist wikis still tend to provide more detailed information, though on a dramatically narrower range of topics.
>
> 2) It is a good question, and I might try to put something about it in the talk, though I think I may already be hitting time constraints as it is.
>
> While the early 20th century generation of typewriter effectively longer exists, one can make the case that computer keyboards are functionally the 21st century incarnation of the technology, so that the typewriter concept has simply adapted and evolved, rather than "died". It seems reasonable to conjecture that something analogous will happen (or is already happening) to journals. In my opinion, the next-generation version of the journal's functions of peer review and editing has not yet emerged, though it is conceivable this could happen in the near future. But I don't have a clear prediction as to exactly what will happen to the academic journal system, other than that it is likely to change from the status quo, and that the internet will somehow be involved.
>
> With regards to collaboration, a certain minimum fraction of actual physical interaction still seems essential, so we will definitely still be seeing physical conferences, classes and seminars for quite a while yet (though I expect many of these to acquire a remote viewing option – or better yet, a remote interaction option – also). This minimum fraction, though, can be quite small – I tend to see my collaborators face-to-face about one week of the year on average, and this seems to be enough to sustain the long-distance collaboration over the other 51 weeks.

 **Carlo** · 28 August 2009

Dear Terry,
on page 28 you write "via Guiseppi Melfi". I think this should be "Giuseppe Melfi" (or at least the name sounds italian, and Guiseppi is not italian, while Giuseppe is).
Best,
Carlo

 **domotorp** · 28 August 2009

Nice presentation, I would just like to mention one small idea – on the slide where you show your own blog, you could show this post about the presentation itself. This might give it a nice metatwist.

 **Michael Nielsen** · 28 August 2009

Lovely talk, Terry. A few immediate thoughts as I browse through the talk:

* You write: “Thanks to the internet, the type of insights once reserved for seminars or conference hallways can now be preserved and accumulated.” An interesting additional aspect is that the best insights can also more and more easily be found by future mathematicians, at least when search engines do a good job of ranking. I regularly come across your posts in Google searches. The logs for my blog show a lot of people arrive at my blog that way – three of the most popular search terms are “Jordan-Wigner transformation”, “expander graphs” and “Yang-Mills theories”.

* Blogs break boundaries in interesting ways. Prior to 2007, I didn’t follow research in mathematics. I’d very occasionally read a mathematical paper as part of my work in theoretical physics, but that was all. RSS makes it so easy to follow blogs that nowadays I read a dozen or so mathematical blogs. It certainly hasn’t turned me into a mathematician, but I do know more about what’s going on in mathematics.

* Some minor details: Polymath1 took 37 days from Tim’s first research post to “Problem Probably Solved”. There were approximately 800 mathematical comments.

 **Vidkun** · 28 August 2009

What about proof assistants (such as HOL, coq, etc)? Georges Gonthier (who provided a formalized proof of the four colour theorem in 2005) is currently involved in a project aiming for a formalization of the Feit-Thompson theorem; is it conceivable that these tools will one day evolve into a technology used by ordinary mathematicians?

That is, in the same way that mathematicians nowadays are supposed to provide a Latex manuscript when publishing a paper – not just the ordinary written text – could one in the future be expected to provide a formalized proof of the theorem along with the ordinary article? (This would essentially remove the whole need for a peer review system, at least as far as this is only supposed to guarantee correctness of the claimed results.)

 **Adam** · 28 August 2009

Hi Terry,
The thing with journals is that they are ranked by impact factor. In some countries, in addition to a salary, an author is paid for publications according to a scale based on the factor. This might be necessary due to extremely corruptive tendencies of some societies. So having only arxiv won’t do. The question is whether refereeing is always on a peer level, like it is supposed to be.

 **Joseph Corneli** · 28 August 2009

This quote from the talk sums up a problem we’ve been
concerned about at PlanetMath since around 2006:

> “There are many promising technologies out there to help do research better. In some ways, there are too many such technologies. And they don’t always work well with each other.”

Our idea is to develop a “meta-commons” that will help coordinate between disparate projects in math. In fact, soon we may have a staff person (me) with a few hours a week to devote to this coordination project.

PlanetMath is still not very well funded, and in any case, we can’t do this project alone, so if anyone in another part of the online-math market has time or resources to put towards this collaboration, please get in touch!

For some background, see:
http://wiki.planetmath.org/AsteroidMeta/metacommons_manifesto

A couple other quick notes: (1) I think the talk is an excellent survey of the “stakeholders”; (2) I’d love to have this talk be the beginning of a conversation about next steps…

> “these issues should fade with time as later generations of tools become easier to use, more integrated, and more mainstream.”

How can we work together to bring this about?

markchicobay · 28 August 2009

Hey Terry long time since PAC. Looking forward to seeing your talk in Melbourne.

Can I make a suggestion re your slides. On slides 15,16,17, n+1, :) etc, the comment for discussion is at the bottom of the slide and the image on top.

This is probably not a good idea. It will be harder for the audience to see your comment and thus understand your slide.

Put the comment at the top of the slide, where it is clearly visible to everyone. Consider the case of people at the back of the theatre with heads in front of them, the comment at the bottom of the slide will not be visible at all.

Mark

markchicobay · 28 August 2009

Another way the internet has changed things for mathematicians is the collaborative processing (computing) power available through principles of distributed processing and more recently cloud computing. eg http://www.mersenne.org/ searching for Mersenne primes using desktops all around the world.

Without the internet researchers would be only able to use local computing power. Might be worth a mention.

M

 **Manjil P. Saikia** · 30 August 2009

The talk is exciting, depressed that I won't be able to be present there. Prof. Tao, do you have any plans of coming to India in the near future.

Also I thought mention should have been made of specifically math wikis and http://www.mersenne.org

 **Mike Rotkowitz** · 30 August 2009

Terry, I'm looking forward to it, and especially to Tuesday's lecture on CS. Will you be able to similarly post slides ahead of time for that as well? Thanks, –Mike

 **Terence Tao** · 30 August 2009

Thanks for all the suggestions! I've incorporated them into the latest version of the talk, which is likely to be the version I will be given this evening; updated links are in the main post.

I should be able to post a few more of the Mahler lectures in a few days. (An old version of the compressed sensing talk can be found here.)

 **Joseph Corneli** · 30 August 2009

FYI and FWIW…

I've put up a wiki page with links to all of the items discussed in Terry Tao's talk (or their best representatives on the web), plus a few extras I found in the process:

http://wiki.planetmath.org/AsteroidMeta/Surveying_the_Math_Metacommons

I have further started a "stakeholder analysis", beginning with "use cases" and "some potential problems". Only in the brainstorming phase at present! I'm happy to discuss further: I created a google group where we could have an in-depth discussion on "how to move forward" — i.e. w/o hijacking this blog.

http://groups.google.com/group/math-meta?hl=en

And of course you're welcome to edit the wiki — note, you will have to be added to the editors list; posting to the the google group would be a good way to introduce yourself to our little enclave & secure editing permission. I know there are plenty of items that aren't on the list yet!

Joe

 **anon** · 31 August 2009

lol I thought it was the other way round, that "maths is useful for the internet"

 **Mark** · 31 August 2009

Hi Terry thanks for your talk on Monday!

One thing I wanted to raise is that all this collaboration is wonderful, but don't get complacent about backups.

Just because the work is "on the internet" doesn't mean it is safe from hardware failure. We would like to think so but if you check the WordPress Terms of Service for wordpress.com you will see you have nothing to rely on.

If the site has a hardware failure and months of mathematical posts are lost, it's gone. Maybe they have a backup and it works, but maybe they don't. You're relying on a free service to do real work. In a commercial context it would be flagged as a very big risk.

Never, ever, rely solely on third parties for backups.

Always make your own backup. Always!

Think it can't happen to a commercial company with millions of users? Think again: http://en.wikipedia.org/wiki/Ma.gnolia

Mark Harrigan · 31 August 2009

Terry – thanks for the talk – I enjoyed it very much and was particularly interested in the example of collaboration leading to a solution of a specific mathematical problem (combinatorial approach to desnity Hales-Jewitt). A fascinating form of meta-cognition. I do a lot of collaborative technical problem solving and am curious at to whether the particular meta-cognitive approach used was guided or emergent (self-organising). By "guided" I mean did one (or more) of the collaborators take it upon themselves to guide the discustion and act as arbiter (where required) as to the best/better options. By emergent I mean did the group "self-organise" and converge toward a solution without guidance. Or was it a mixture? Any elaboration you can provide? :)
